

CYCLE 2

Consider a COMPANY database.

Create the following three tables in the database and insert atleast 5 records in each table.

1. EMPLOYEE

EMPLOYEE(EmpID, Ename, DOB, City, DOJ, Salary, DeptID)

2. DEPARTMENT

DEPARTMENT(DeptID, DeptName, Location, Fund)

3. DEPENDENT

DEPENDENT(DependentName, Age, Gender, EmpID, Relation_with_employee).

NOTE:

- ◆ Give appropriate Primary key and Foreign key constraints.
- ◆ Default value of Salary in the EMPLOYEE table should be 0.
- ◆ Gender in DEPENDENT table should accept either of the three values, 'Male', 'Female' or 'Others' only.

Perform the following queries.

Implementation of Aggregate functions

1. Find total number of employees in the company.
2. Find maximum salary in the company.
3. Find youngest dependent age
4. Find total salary paid to all employees who joined the company in the year 2022.
5. Find average age of dependents of employee with Employee ID 5.

Implementation of Group by, Order by and having clauses

1. Find average salary of employees in each department.
2. Count the number of dependents for each employee.
3. List employees ordered by salary (highest first).
4. List employees ordered by Date of Joining (latest first).
5. Find departments having more than 5 employees.
6. Find departments where average salary is greater than 50,000.
7. List departments with more than 3 employees, ordered by average salary.

Consider a COMPANY database with the following three tables.

1. EMPLOYEE

EMPLOYEE(EmpID, Ename, DOB, City, DOJ, Salary, DeptID)

2. DEPARTMENT

DEPARTMENT(DeptID, DeptName, Location, Fund)

3. DEPENDENT

DEPENDENT(DependentName, Age, Gender, EmpID, Relation_with_employee).

Practice of SQL TCL commands : savepoint, rollback, commit

1. Start a new transaction. Change the salary of the employee whose EmpID is 5 as 50000/-. Undo the update operation. Commit the transaction and display the changes to the table .
2. Start a new transaction. Delete a record from EMPLOYEE table. Then, insert a new record in DEPENDENT table. Undo the insert operation only at first. Then, undo the delete operation also. Commit the transaction and display the changes to the table .

CYCLE 3

Consider a COMPANY database with the following three tables.

1. EMPLOYEE

EMPLOYEE(EmpID, Ename, DOB, City, DOJ, Salary, DeptID)

2. DEPARTMENT

DEPARTMENT(DeptID, DeptName, Location, Fund)

3. DEPENDENT

DEPENDENT(DependentName, Age, Gender, EmpID, Relation_with_employee).

Practice of SQL Set Operators

1. Combines employee names and dependent names into a single list.
2. List all cities where either employees stay or departments are located including duplicates.
3. Find cities where both employees live and departments are located
4. Display the names that appear both as employee names and dependent names
5. Display the Ids of the Employees who have no dependents

Practice of SQL Join operators

1. List employee name and department name of each employee.
2. Display the name of employees working in the 'HR' Department
3. List the employees whose dependents are older than 18
4. List the name of employees with more than one dependent
5. List all employees and dependents using left join
6. List all employees and their department using right join
7. Display all employees and all departments, including employees without departments and departments without employees.
8. List the name of employees and department names of those employees that have no dependents

Practice of SQL nested queries

1. List the name of employees who earn more than the average salary of all employees
2. List the name of employees working in the department named 'HR'
3. Display the name and salary of the employees who have at least one dependent.
4. Display the name, ID and DOJ of employees who do NOT have any dependents.
5. Display the name, DeptID and DOB of employee(s) with the highest salary in the company.
6. List the Employee names who earn more than every employee in departments located in 'Delhi'
7. List the employee names who do NOT work in departments with fund less than company average fund

Practice of SQL VIEWS

1. Create a view that contains details of Employees staying in Bangalore.
2. Create a view that contains Employee basic details with their department names
3. Create a view that contains names of employees in CS department
4. Drop the created views
